

PACE1754/SOS PROCESSOR INTERFACE CIRCUIT (PIC) CMOS/SOS SPACE PROCESSOR MICROPERIPHERAL

FEATURES

- The PACE1754 (PIC) is a support chip for the PACE1750A/AE Processors. It eliminates the SSI/MSI Logic and external system functions required in typical 1750A implementations.
- Provides a significant savings in part-count and power dissipation enhancing reliability and overall system speed performance.
- Provides an optimal interface when used with the PACE1753 MMU/COMBO in a full 1750A implementation.
- Provides the following additional important system functions:
 - Programmable READY for memory and I/O
 - Automatic READY during self-test and internal I/O instructions
 - 100KHz timer clock output provided
 - Programmable system watchdog—ranges from 1 μ s to 1 minute
 - Programmable Bus time-out function
 - Memory Parity generation/detection
 - Error detection of unimplemented memory and/or I/O space addressing
 - First failing memory address register for diagnostics
 - High drive three-state address latches
 - Built-in system test program—automatically tests the PACE1750A/AE CPUs, PACE1753 MMU/COMBO, PACE1754 PIC and system address lines as well as memory and I/O strobes
 - System configuration decoding and buffering
 - Interrupt acknowledge decoder and strobe
 - Start up ROM support per MIL-STD-1750A
 - Memory or I/O READ/WRITE three-state strobes with external three-state control for DMA applications
- Available with Class S manufacturing, screening, and testing.
- SOS insulated substrate technology provides absolute latch-up immunity and excellent SEU tolerance.
- SOS devices are fully interchangeable with application-proven SMD CMOS P1754 devices.
- 20, 25 and 30 MHz operation over full Military Temperature Range

- Single 5V \pm 10% Power Supply
- Available in:
 - 68-Lead Quad Pack with optional Gull Wing Surface Mount

PACE1754 PROCESSOR INTERFACE CIRCUIT DESCRIPTION

The PACE1754 Processor Interface Circuit (PIC) is a single chip implementation of many special system functions that are often required when using the PACE1750A/AE, a single chip microprocessor. The PIC allows a system designer to design a higher performance, more efficient microprocessor system which uses less power and takes up less board space.

The PIC provides many important system functions. These functions are governed by respective bit positions in a programmable Control Register which is incorporated in the PIC. The individual bits of the control register are set to select the various features and are set to a specified default value upon Reset.

**ABSOLUTE MAXIMUM RATINGS¹**

Supply Voltage Range	0.5V to +7.0V
Input Voltage Range	0.5V to $V_{CC} + 0.5V$
Storage Temperature Range	-65°C to +150°C
Input Current Range	-30mA to +5mA
Current applied to any output ³	150mA
Maximum Power Dissipation ²	1.5W
Lead Temperature Range (soldering 10 seconds)	300°C
Thermal resistance (θ_{JC}): Packages QL and QG	8°C/W

Notes:

1. Stresses above the absolute maximum rating may cause permanent damage to the device. Extended operation at the maximum levels may degrade performance and affect reliability.
2. Must withstand the added power dissipation due to short circuit test e.g., I_{OS} .
3. Duration 1 second or less.

RECOMMENDED OPERATING CONDITIONS

Case Temperature	GND	V_{CC}
-55°C to +125°C	0	4.5V to +5.5V

DC ELECTRICAL SPECIFICATIONS (Over recommended operating conditions)

Symbol	Parameter	Min	Max	Unit	Conditions ¹	
V _{IH}	Input HIGH Voltage	2.0	V _{CC} + 0.5	V

STRT ROM

Timer Clk

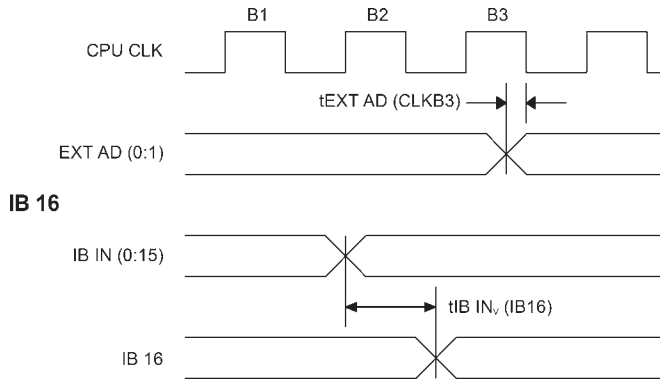

IB Bus Output (0:15)

EX AD ER

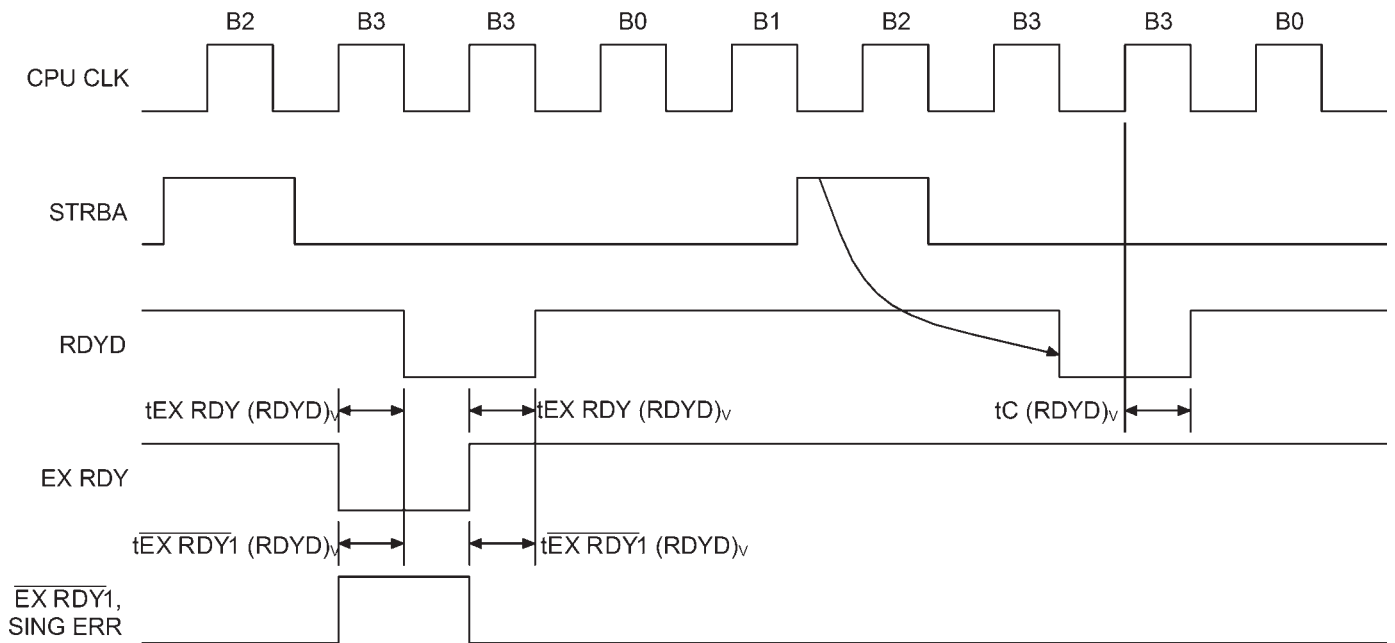

Extended Addresses (0:1)

Note: All time measurements on active signals relate to 1.5V levels.

RDYD Timing

TEST END Timing¹

Notes:

1. The last two instructions executed during system test are: XIO RA, 1F44, 0 and JC 7, 0000 hex, 0. After execution of the IOW bus cycle, the XIO proceeds by filling the instruction pipe with two memory read bus cycles where the opcode 7070 hex and 0000 hex are entered to the processor. As from the end of STRBD in the second cycle, TEST END is asserted. At this point, the execution of IC starts by first issuing two fetch cycles from the "old PC" (from addresses XXXX & XXXX+1). The data will be taken from system memory (because TEST END is asserted) but both the address and data are irrelevant. Following that, IC will start filling the pipe from address 0000 hex and 0001 hex, now from the system memory to start user's program execution.
2. All time measurements on active signals relate to 1.5V levels.

Address Bus and Strokes

Note: All time measurements on active signals relate to 1.5V levels.

TEST CIRCUITS

Standard Output (Non Three-State)

Three-State

Note: All time measurements on active signals relate to 1.5V levels.

Parameter	V_O	V_{MEA}
TPLZ	$\geq 3V$	0.5V
TPHZ	0V	$V_{CC} - 0.5V$
TPXL	$V_{CC}/2$	1.5V
TPXH	$V_{CC}/2$	1.5V

**PIN FUNCTIONS**

Symbol	Name	Description
CPUCLK	CPU Clock	A single-phase input clock signal (0-40MHz, 40% to 60% duty cycle.)
STRBA	Strobe Address	An active HIGH input which latches the contents of IB(0:15) into the address latches.
$\overline{\text{STRBD}}$	Strobe Data	An active LOW input which is used for writing or reading data to or from the device and also to produce the external memory and I/O strobes.
TIMERCLK	Timer Clock	A 100KHz output (fixed frequency) based on the programmed operating frequency of the CPU clock.
$\overline{\text{MEMW}}$	Memory Write Strobe	An active LOW output produced in memory write cycles.
$\overline{\text{MEMR}}$	Memory Read Strobe	An active LOW output produced in memory read cycles.
$\overline{\text{IOW}}$	I/O Write Strobe	An active LOW output produced in output write cycles.
$\overline{\text{IOR}}$	I/O Read Strobe	An active LOW output produced in input read cycles.
$\overline{\text{INTA}}$	Interrupt Acknowledge Strobe	An active LOW output produced after any interrupt, corresponding to an output write to address 1000 (hex).
$\overline{\text{SCR EN}}$	System Configuration	An active LOW output (in 64 pin only) produced any time an input read from address 8410 (hex), read system configuration is executed.
$\overline{\text{STRBEN}}$	Strobe Enable	An active LOW input, enabling the active state of the address outputs and the $\overline{\text{MEMR}}$, $\overline{\text{MEMQ}}$, $\overline{\text{IOR}}$, and $\overline{\text{IOW}}$ outputs. When at a logic "1" (if enabled by bits EST, EAD of the control register) it will correspondingly enable the three-state state of the above signals.
IB ₀ - IB ₁₅	Information Bus (0:15)	A bi-directional time multiplexed bus. It is an input during the address phase of any bus cycle and also during the data phase when writing. It is an output during the data phase when reading from the device.
IB ₁₆	Information Bus (16)	A bi-directional line. It is an output during write cycles and an input during read cycles. It is used to implement the parity function at the system level.
A(0:1)/ EX AD(0:1), A(2:15)	Address Bus (0:15)	An active HIGH output bus. Contains the address of the current bus cycle as latched by the end of STRBA. In system configurations including the MMU function, the only active lines during memory are A(4:15). In this case, A(2:3) are high impedance (don't care) and A(0:1) turn into inputs called Extended Addresses, EXT ADR (0:1). In this case, these two lines supplied by the MMU, will be used to operate the programmable ready generation during bus cycles.
$\overline{\text{M/IO}}$	Memory I/O	An input qualifier indicating the nature of the current bus cycle.

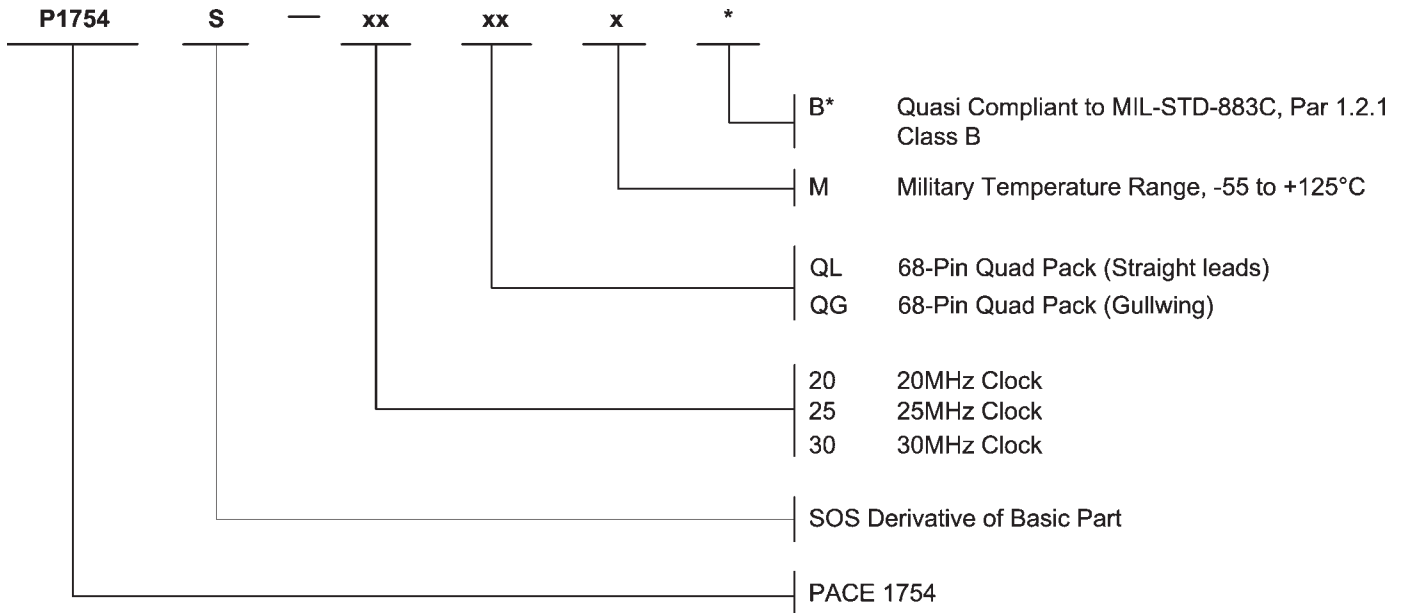

PIN FUNCTIONS (Continued)

Symbol	Name	Description
$\overline{R/W}$	Read or Write	An input qualifier indicating the nature of the current bus cycle, either Read (1) or Write (0).
\overline{RESET}	External Reset	An active LOW input used to initialize the device's hardware.
$\overline{TEST ON}$	System Test Enable	An active LOW input used to enable the execution of the System Test built into the device, immediately after completion of the P1750A/AE initialization and before fetching any instruction from the user program.
TEST END	System Test End	An active HIGH output indicating whether the system test in the device has been completed. Whenever the system test is disabled by the $\overline{TEST ON}$ signal, the TEST END output will be at a logical "1" immediately after RESET is removed.
STRT ROM	Start Up ROM	An output following the execution of the ESUR and DSUR, I/O commands as defined in MIL-STD-1750A. It will be at the logical "1" level after executing ESUR and at the logical "0" level after executing DSUR. Initially, it defaults to a logical "1".
RDYD	Ready Data	An active HIGH output to be connected to the P1750A/AE input to control the bus cycle termination.
EXRDY	External Ready Data	An active HIGH input which at logical "0" overrides the internal RDYD generation and forces it to a logical "0".
$\overline{EX RDY}_1$	External Ready Data	An active LOW input which at logical "1" overrides the internal RDYD generation and forces it to a logical "0".
$\overline{ME PA ER}/$ RAM DIS	Memory Parity Error	An active LOW output indicating a parity error when reading from memory. It becomes an active HIGH output called RAM DISABLE for handshaking with the P1753 MMU when the device is programmed to support EDAC.
$\overline{EX AD ER}/$ SINGERR	Illegal Address Error	An active LOW output indicating an illegal address error when referencing memory or I/O. It becomes an active HIGH output called SINGLE ERROR for handshaking with the P1753 MMU when the device is programmed to support EDAC.
TC	Terminal Count	An active HIGH output indicating a Bus time out or a watchdog trigger.
SC ₀ –SC ₄	System Configuration	Inputs which are buffered onto IB ₀ –IB ₄ when executing an I/O read from I/O address 8410 (hex), system configuration.
GND	Ground	0 volts system ground.
V _{CC}	Power Supply	5 volts ± 10% power supply.

ORDERING INFORMATION

CASE OUTLINE 1:

68 Lead Quad Pack with Straight Leads (Ordering Code QL)

NOTES:

- 1) Dimensions are in inches.
- 2) Metric equivalents are given for general information only.
- 3) Unless otherwise specified, tolerances are .02 (0.5 mm) for two place decimals and .005 (0.13 mm) for three place decimals.
- 4) Pin 1 indicator can be either rectangle, dot, or triangle at specified location or referenced to the uniquely beveled corner.
- 5) Corners indicated as notched may be either notched or square.

CASE OUTLINE 2:

68 Lead Quad Pack with Gullwing Leads (Ordering Code QG)

NOTES:

- 1) Dimensions are in inches.
- 2) Metric equivalents are given for general information only.
- 3) Unless otherwise specified, tolerances are .02 (0.5 mm) for two place decimals and .005 (0.13 mm) for three place decimals.
- 4) Pin 1 indicator can either be rectangle, dot, or triangle at specified location or referenced to the uniquely beveled corner.
- 5) Corners indicated as notched may be either notched or square (with radius).
- 6) Case 2 is derived from Case 1 by forming the leads to the shown gullwing configuration.
